BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

**As rescanning documents *will not* correct images,
please do not report the images to the
Image Problem Mailbox.**

Attorney Docket No.: DEX-0249
Inventors: Sun et al.
Serial No.: 10/082,830
Filing Date: October 29, 2001
Page 3

Amendments to the Specification:

Please replace the paragraph beginning at page 1, line 4, with the following rewritten paragraph:

This application claims the benefit of priority from U.S. Provisional Application Serial No. ~~60/243,805~~ 60/243,802 filed October 27, 2000, which is herein incorporated by reference in its entirety.

Please replace the paragraph beginning at page 35, line 6 with the following rewritten paragraph:

Nucleotide sequences of the instantly-described nucleic acids were determined by sequencing a DNA molecule that had resulted, directly or indirectly, from at least one enzymatic polymerization reaction (e.g., reverse transcription and/or polymerase chain reaction) using an automated sequencer (such as the ~~MegaBACE™~~ MEGABACE™ 1000, Molecular Dynamics, Sunnyvale, CA, USA). Further, all amino acid sequences of the polypeptides of the present invention were predicted by translation from the nucleic acid sequences so determined, unless otherwise specified.

Attorney Docket No.: DEX-0249
Inventors: Sun et al.
Serial No.: 10/082,830
Filing Date: October 29, 2001
Page 4

Please replace the paragraph beginning at page 36, line 1 with the following rewritten paragraph:

Commercially available fluorescent nucleotide analogues readily incorporated into the nucleic acids of the present invention include Cy3-dCTP, Cy3-dUTP, Cy5-dCTP, Cy3-dUTP (Amersham Pharmacia Biotech, Piscataway, New Jersey, USA), fluorescein-12-dUTP, tetramethylrhodamine-6-dUTP, Texas Red @-5-dUTP, Cascade Blue @-7-dUTP, BODIPY @ FL-14-dUTP, BODIPY @ TMR-14-dUTP, BODIPY @ TR-14-dUTP, ~~Rhodamine-Green™~~ Rhodamine Green™-5-dUTP, Oregon Green @ 488-5-dUTP, Texas Red @-12-dUTP, BODIPY @ 630/650-14-dUTP, BODIPY @ 650/665-14-dUTP, Alexa Fluor @ 488-5-dUTP, Alexa Fluor @ 532-5-dUTP, Alexa Fluor @ 568-5-dUTP, Alexa Fluor @ 594-5-dUTP, Alexa Fluor @ 546-14-dUTP, fluorescein-12-UTP, tetramethylrhodamine-6-UTP, Texas Red @-5-UTP, Cascade Blue @-7-UTP, BODIPY @ FL-14-UTP, BODIPY @ TMR-14-UTP, BODIPY @ TR-14-UTP, ~~Rhodamine-Green™~~ Rhodamine Green™-5-UTP, Alexa Fluor @ 488-5-UTP, Alexa Fluor @ 546-14-UTP (Molecular Probes, Inc. Eugene, OR, USA). One may also custom synthesize nucleotides having other fluorophores. See Henegariu et al., Nature Biotechnol. 18: 345-348 (2000), the disclosure of which is incorporated herein by reference in its entirety.

Attorney Docket No.: DEX-0249
Inventors: Sun et al.
Serial No.: 10/082,830
Filing Date: October 29, 2001
Page 5

Please replace the paragraph beginning at page 37, line 1 with the following rewritten paragraph:

Other post-synthetic approaches also permit internal labeling of nucleic acids. For example, fluorophores can be attached using a cisplatin reagent that reacts with the N7 of guanine residues (and, to a lesser extent, adenine bases) in DNA, RNA, and PNA to provide a stable coordination complex between the nucleic acid and fluorophore label (Universal Linkage System) (available from Molecular Probes, Inc., Eugene, OR, USA and Amersham Pharmacia Biotech, Piscataway, NJ, USA); see Alers et al., Genes, Chromosomes & Cancer 25: 301- 305 (1999); Jelsma et al., J. NIH Res. 5: 82 (1994); Van Belkum et al., BioTechniques 16: 148-153 (1994), incorporated herein by reference. As another example, nucleic acids can be labeled using a disulfide-containing linker (~~FastTag~~ FASTTAG[™] Reagent, Vector Laboratories, Inc., Burlingame, CA, USA) that is photo- or thermally-coupled to the target nucleic acid using aryl azide chemistry; after reduction, a free thiol is available for coupling to a hapten, fluorophore, sugar, affinity ligand, or other marker.

Attorney Docket No.: DEX-0249
Inventors: Sun et al.
Serial No.: 10/082,830
Filing Date: October 29, 2001
Page 6

Please replace the paragraph beginning at page 48, line 24 with the following rewritten paragraph:

Expression control sequences for yeast cells, typically *S. cerevisiae*, will include a yeast promoter, such as the CYC1 promoter, the GAL1 promoter, the GAL10 promoter, ADH1 promoter, the promoters of the yeast ~~mating~~ α -mating system, or the GPD promoter, and will typically have elements that facilitate transcription termination, such as the transcription termination signals from the CYC1 or ADH1 gene.

Please replace the paragraph beginning at page 51, line 9 with the following rewritten paragraph:

Vectors for phage display fuse the encoded polypeptide to, e.g., the gene III protein (pIII) or gene VIII protein (pVIII) for display on the surface of filamentous phage, such as M13. See Barbas et al., Phage Display: A Laboratory Manual, Cold Spring Harbor Laboratory Press (2001); Kay et al. (eds.), Phage Display of Peptides and Proteins: A Laboratory Manual, Academic Press, Inc., (1996); Abelson et al. (eds.), Combinatorial Chemistry (Methods in Enzymology, Vol. 267) Academic Press (1996). Vectors for yeast display, e.g. the pYD1 yeast display vector (Invitrogen, Carlsbad, CA, USA), use the ~~agglutinin~~

Attorney Docket No.: DEX-0249
Inventors: Sun et al.
Serial No.: 10/082,830
Filing Date: October 29, 2001
Page 7

α -agglutinin yeast adhesion receptor to display recombinant protein on the surface of *S. cerevisiae*. Vectors for mammalian display, e.g., the ~~pDisplay~~ PDISPLAY™ vector (Invitrogen, Carlsbad, CA, USA), target recombinant proteins using an N-terminal cell surface targeting signal and a C-terminal transmembrane anchoring domain of platelet derived growth factor receptor.

Please replace the paragraph beginning at page 53, line 10 with the following rewritten paragraph:

Replication incompetent retroviral vectors, typically derived from Moloney murine leukemia virus, also are useful for creating stable transfectants having integrated provirus. The highly efficient transduction machinery of retroviruses, coupled with the availability of a variety of packaging cell lines such as ~~RetroPack~~ RETROPACK™ PT 67, ~~EcoPack2~~ ECOPACK2™-293, AmphoPack-293, and GP2-293 cell lines (all available from Clontech Laboratories, Palo Alto, CA, USA), allow a wide host range to be infected with high efficiency; varying the multiplicity of infection readily adjusts the copy number of the integrated provirus.

Attorney Docket No.: DEX-0249
Inventors: Sun et al.
Serial No.: 10/082,830
Filing Date: October 29, 2001
Page 8

Please replace the paragraph beginning at page 54, line 3 with the following rewritten paragraph:

Polypeptides of the invention may be post-translationally modified. Post-translational modifications include phosphorylation of amino acid residues serine, threonine and/or tyrcsine, N-linked and/or O-linked glycosylation, methylation, acetylation, prenylation, methylation, acetylation, arginylation, ubiquination and racemization. One may determine whether a polypeptide of the invention is likely to be post-translationally modified by analyzing the sequence of the polypeptide to determine if there are peptide motifs indicative of sites for post-translational modification. There are a number of computer programs that permit prediction of post-translational modifications. See, e.g., www.expasy.org [expasy](http://expasy.org) [with the extension .org of the world wide web](http://expasy.org) (accessed August 31, 2001), which includes PSORT, for prediction of protein sorting signals and localization sites, SignalP, for prediction of signal peptide cleavage sites, MITOPROT and Predotar, for prediction of mitochondrial targeting sequences, NetOGlyc, for prediction of type O-glycosylation sites in mammalian proteins, big-PI Predictor and DGPI, for prediction of prenylation-anchor and cleavage sites, and NetPhos, for prediction of Ser, Thr and Tyr

Attorney Docket No.: DEX-0249
Inventors: Sun et al.

Please replace the paragraph beginning at page 56, line 25 with
the following rewritten paragraph:

In another embodiment, the invention provides polypeptides
that have been post-translationally modified. In one embodiment,
polypeptides may be modified enzymatically or chemically, by
addition or removal of a post-translational modification. For
example, a polypeptide may be glycosylated or deglycosylated
enzymatically. Similarly, polypeptides may be phosphorylated
using a purified kinase, such as a MAP kinase (e.g, p38, ERK, or
JNK) or a tyrosine kinase (e.g., Src or erbB2). A polypeptide
may also be modified through synthetic chemistry. Alternatively,
one may isolate the polypeptide of interest from a cell or tissue
that expresses the polypeptide with the desired
post-translational modification. In another embodiment, a

Attorney Docket No.: DEX-0249
Inventors: Sun et al.
Serial No.: 10/082,830
Filing Date: October 29, 2001
Page 11

nucleic acid molecule encoding the polypeptide of interest is introduced into a host cell that is capable of post-translationally modifying the encoded polypeptide in the desired fashion. If the polypeptide does not contain a motif for a desired post-translational modification, one may alter the post-translational modification by mutating the nucleic acid sequence of a nucleic acid molecule encoding the polypeptide so that it contains a site for the desired post-translational modification. Amino acid sequences that may be post-translationally modified are known in the art. See, e.g., the programs described above on the website ~~www.expasy.org~~ expasy with the extension .org of the world wide web. The nucleic acid molecule is then ~~be~~ introduced into a host cell that is capable of post-translationally modifying the encoded polypeptide. Similarly, one may delete sites that are post-translationally modified by either mutating the nucleic acid sequence so that the encoded polypeptide does not contain the post-translational modification motif, or by introducing the native nucleic acid molecule into a host cell that is not capable of post-translationally modifying the encoded polypeptide.

Serial No.: 10/082,830
Filing Date: October 29, 2001
Page 12

Please replace the paragraph beginning at page 58, line 16 with the following rewritten paragraph:

A wide variety of unicellular host cells are useful in expressing the DNA sequences of this invention. These hosts may include well-known eukaryotic and prokaryotic hosts, such as strains of, fungi, yeast, insect cells such as *Spodoptera frugiperda* (SF9), animal cells such as CHO, as well as plant cells in tissue culture. Representative examples of appropriate host cells include, but are not limited to, bacterial cells, such as *E. coli*, *Caulobacter crescentus*, *Streptomyces* species, and *Salmonella typhimurium*; yeast cells, such as *Saccharomyces cerevisiae*, *Schizosaccharomyces pombe*, *Pichia pastoris*, *Pichia methanolica*; insect cell lines, such as those from *Spodoptera frugiperda*, e.g., Sf9 and Sf21 cell lines, and ~~expresSF~~ EXPRESSETM cells (Protein Sciences Corp., Meriden, CT, USA), *Drosophila* S2 cells, and *Trichoplusia ni* High Five ® Cells (Invitrogen, Carlsbad, CA, USA); and mammalian cells. Typical mammalian cells include BHK cells, BSC 1 cells, BSC 40 cells, BMT 10 cells, VERO cells, COS1 cells, COS7 cells, Chinese hamster ovary (CHO) cells, 3T3 cells, NIH 3T3 cells, 293 cells, HEPG2 cells, HeLa cells, L cells, MDCK cells, HEK293 cells, WI38 cells,

murine ES cell lines (e.g., from strains 129/SV, C57/BL6, DBA-1, 129/SVJ), K562 cells, Jurkat cells, and BW5147 cells. Other mammalian cell lines are well-known and readily available from the American Type Culture Collection (ATCC) (Manassas, VA, USA) and the National Institute of General Medical Sciences (NIGMS) Human Genetic Cell Repository at the Coriell Cell Repositories (Camden, NJ, USA). Cells or cell lines derived from breast are particularly preferred because they may provide a more native post-translational processing. Particularly preferred are human breast cells.

Please replace the paragraph beginning at page 59, line 20 with the following rewritten paragraph:

Plasmid vectors will typically be introduced into chemically competent or electrocompetent bacterial cells. *E. coli* cells can be rendered chemically competent by treatment, e.g., with CaCl_2 , or a solution of Mg^{2+} , Mn^{2+} , Ca^{2+} , Rb^+ or K^+ , dimethyl sulfoxide, dithiothreitol, and hexamine cobalt (III), Hanahan, J. Mol. Biol. 166(4):557-80 (1983), and vectors introduced by heat shock. A wide variety of chemically competent strains are also available commercially (e.g., Epicurian Coli @ XL10-Gold @ Ultracompetent Cells (Stratagene, La Jolla, CA, USA); DH5 competent cells
